Recent Innovation

- **Artificial Intelligence**
 - AI is the ability of computers to perform a task that typically requires some level of human intelligence.
- **Machine Learning**
 - Type of engine that uses data driven algorithms to learn from data to give users the answers that's required.
- **Deep Learning**
 - **Type of machine learning**, and it refers to deep neural networks, that are inspired from and loosely resemble the human brain

Machine Learning Tools in ArcGIS

Classification

- Pixel & Object Based
- Image Segmentation
- Maximum Likelihood
- Random Trees
- Support Vector Machine

Deep Learning

- Generate training samples
- Detect objects
- Classify pixels

Clustering

- Spatially Constrained Multivariate Clustering
- Multivariate Clustering
- Density-based Clustering
- Hot Spot Analysis
- Cluster and Outlier Analysis
- Space Time Pattern Mining

Prediction

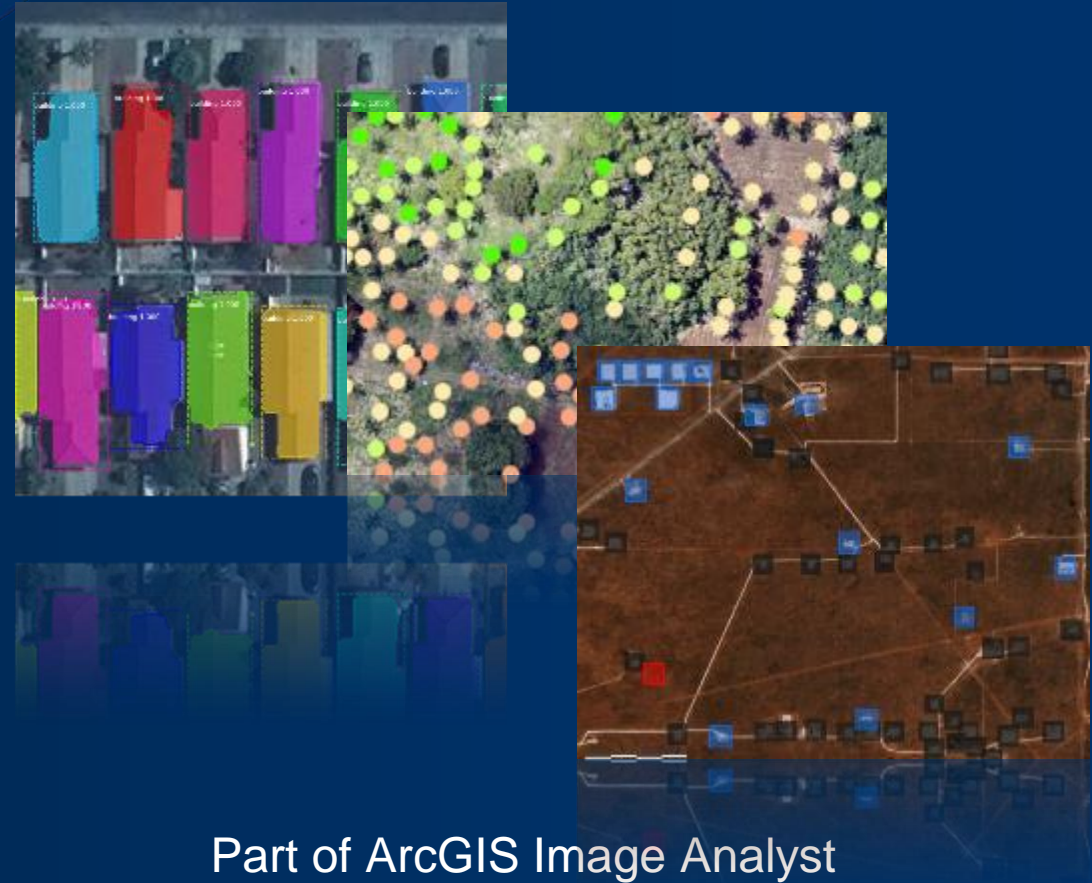

- Empirical Bayesian Kriging
- Areal Interpolation
- EBK Regression Prediction
- Ordinary Least Squares Regression and Exploratory Regression
- Geographically Weighted Regression

Deep Learning with Imagery in ArcGIS

ArcGIS supports end-to-end deep learning workflows

- Tools for:
 - Labeling training samples
 - Preparing data to train models
 - Training Models
 - Running Inferencing
- Supports all 4 imagery deep learning categories
- Supports image space, leverage GPU
- Clients
 - ArcGIS Pro
 - Map Viewer
 - Notebooks

Part of ArcGIS Image Analyst
Run distributed on ArcGIS Image Server

Run

- Support for Deep Learning out of the box

	Detect Objects	Classify Pixels
Tensor Flow	<i>Object Detection API</i>	<i>DeepLabs</i>
Keras	<i>Mask RCNN</i>	
PyTorch	<i>fast.ai - SSD</i>	
CNTK	<i>Faster RCNN by Microsoft</i>	<i>U-Net by Microsoft Azure</i>

Tensor Flow: end-to-end open source platform for machine learning

Keras: Open-source neural-network library written in Python. Capable of running on top of TensorFlow, CNTK and other platform

PyTorch: Open source machine learning library used for computer vision and natural language processing, primarily developed by FB AI Research Lab

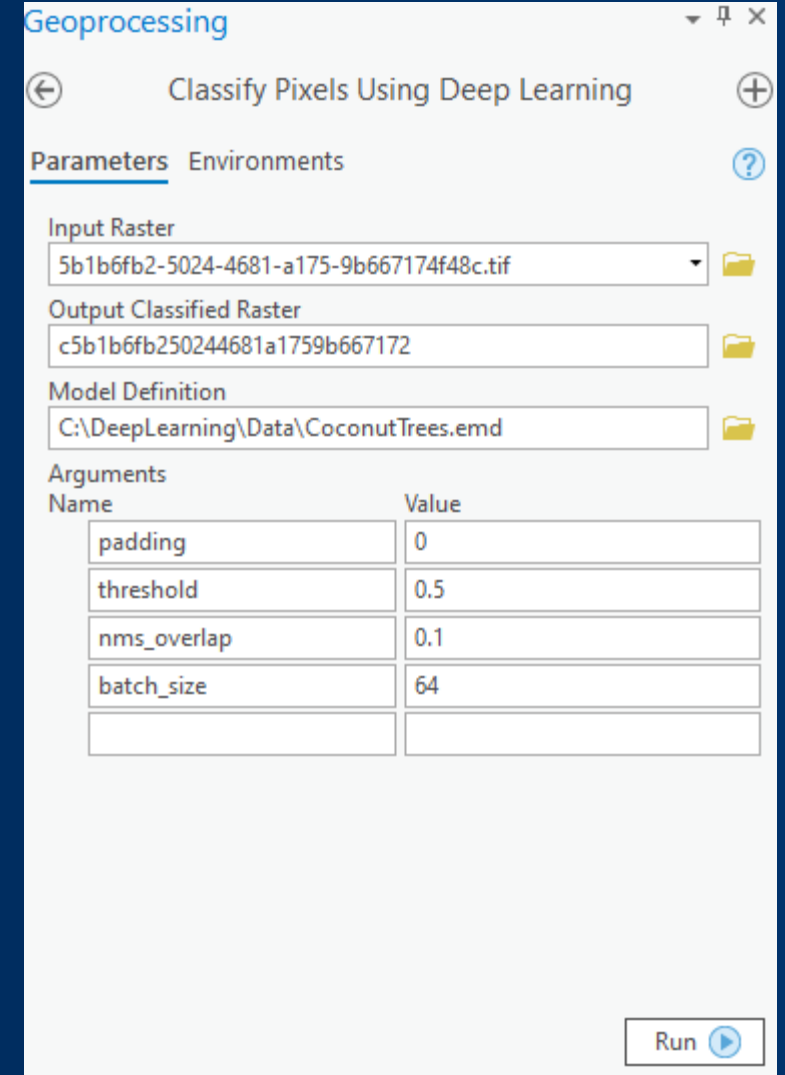

CNTK: Microsoft Cognitive Toolkit, previously known as CNTK - a deep learning framework developed by Microsoft Research

Inference Tools

- **Classify Pixels using Deep Learning**

Runs the model on an input raster to produce classified raster, each valid pixel has an assigned class label

- Built in Python Raster Function for TensorFlow and CNTK
- Mini-batch support
- Processor type: CPU or GPU
- Parallel Processing in ArcGIS Pro
- Distributed raster analysis on Enterprise

Classify Pixels Using Deep Learning – Sample Use Case

Landcover Classification

The screenshot displays the ArcGIS Pro interface for a landcover classification project. The main map area shows a satellite-style image of a river system with various land cover types color-coded: blue for water, green for vegetation, brown for bare land, and red for cultivated crops. The Geoprocessing pane on the right shows the 'Classify Pixels Using Deep Learning' tool with its parameters and arguments.

Geoprocessing: Classify Pixels Using Deep Learning

Parameters:

- Input Raster:
- Output Classified Raster:
- Model Definition:

Arguments:

Name	Value
pooling	0
batch_size	16

Inference Tools

• Detect Objects Using Deep Learning

Runs the model on an input raster to produce feature class containing the object it finds

- Built in Python Raster Function for TensorFlow, Keras, PyTorch and CNTK
- Mini-batch support
- Optional: Non-Maximum Suppression
- Processor type: CPU or GPU
- Parallel Processing in ArcGIS Pro
- Distributed raster analysis on Enterprise

Non Maximum Suppression (Optional)

Performs non-maximum suppression, where duplicate objects are identified and the duplicate feature with a lower confidence value is removed.

- Unchecked—All objects that are detected will be in the output feature class. This is the default.
- Checked—Removes duplicate objects that are detected.

Run

Object Detection using Deep Learning – Sample Output

The screenshot displays a GIS application interface with the following components:

- Menu Bar:** Project, Map, Insert, Analysis, View, Edit, Imagery, Share.
- Toolbar:** Clipboard (Cut, Copy, Copy Path), Navigate (Explore, Bookmarks, Go To XY), Layer (Basemap, Add Data, Add Preset), Selection (Select, Select By Attributes, Select By Location), Inquiry (Attributes, Clear, Infographics, Measure, Locate), Labeling (Pause, View Unplaced, More, Convert To Annotation), Offline (Download Map).
- Contents Panel:**
 - Search bar
 - Drawing Order
 - Map
 - CoconutTrees_FeatureToPoint (Yellow circle)
 - CoconutTrees (Red square)
 - Kolovai Palms (Blue square)
 - RGB Legend
 - Red: Band_1
 - Green: Band_2
 - Blue: Band_3
 - World Topographic Map
 - World Hillshade
- Main Map:** Aerial view of a forested area with numerous yellow circular markers and red square bounding boxes indicating detected objects.

Deep Learning in ArcGIS API for Python

Make model training easier using **arcgis.learn module**

Current
Version
1.7.0

The **arcgis.learn module** is based on PyTorch and fast.ai and enables fine-tuning of pretrained torchvision models on satellite imagery

- Prepare Training Data
 - `arcgis.learn.prepare_data`
- Export Training Data
 - `arcgis.learn.export_training_data`
- Train Models
 - `arcgis.learn.SingleShotDetector`
 - `arcgis.learn.UnetClassifier`
 - `arcgis.learn.FeatureClassifier`
- Model Management
 - `arcgis.learn.list_models`
 - `arcgis.learn.Model`
 - `Model.install`
 - `Model.Uninstall`
 - `Model.query_info`
- Run Inference at SCALE
 - `arcgis.learn.detect_objects`
 - `arcgis.learn.classify_pixels`

Take Away

- **Easy way to extend Deep Learning capabilities to any support Framework/Model configuration**
- **Out of the box Support for most common Deep Learning Frameworks**
- **Leverage the powerful Raster Analytics capabilities to distribute model inference tasks.**
- **Users can easily train the model with ArcGIS API for Python**

Thank you!
